Pingar's Partnership in Intergen's Cohesion Project

The Problem

The NZ Government reviewed its various data management platforms throughout all Ministries in 2011. The conclusion they came to was that there was massive replication of effort, cost, and overhead management. Quickly realising the need to standardise on best of breed data platforms. This would enable better interconnectivity, less suppliers with more invested interest in success, less training, and the assurance of the best solutions. The key challenges were the sheer diversity of content, and massive unstructured data bases of all kinds.

The solution

After over 2 years of detailed evaluation the Microsoft best of breed option was supplied by a local system integrator Intergen Ltd. Their virtual cloud solution encompassing Pingar for auto metadata population, and Colligo for email management is called the Cohesion Solution. Pingar's part in the solution enjoyed great importance as the comprehensive and consistent capture of metadata was needed to assist ingestion, organise, categorize, and populate detailed search refiners.
